Outline

- 1 Invitation: Cubic Equations
- 2 Complex Numbers
- 3 The Complex Plane
- 4 Polar Representation

Solution to Cubic Equations

$$x^3 = 3px + 2q$$

A solution will always exist.

Algebraic solution:

$$x = \left[q + (q^2 - p^3)^{1/2} \right]^{1/3} + \left[q - (q^2 - p^3)^{1/2} \right]^{1/3}$$

$$p = 5, q = 2$$

$$x^3 = 15x + 4$$

$$x = \left[2 + (-121)^{1/2} \right]^{1/3} + \left[2 - (-121)^{1/2} \right]^{1/3}$$

$x = 4$ is a solution.

Conjecture: $\sqrt{-121} = 11i$

$$x = [2 + 11i]^{1/3} + [2 - 11i]^{1/3}$$

Conjecture: $\sqrt{2 + 11i} = 2 + ai$, $\sqrt{2 - 11i} = 2 - ai$, $a \in \mathbb{R}$

Assuming 'intuitive' algebraic rules (Closure, Commutative, Associative, Distributive properties), conjecture consistent with $a = \pm 1$

Complex Algebra

Complex number: $z = x + iy$ $x, y \in \mathbb{R}$

Algebraic rules for addition and multiplication:

$$z_1 = x_1 + iy_1, z_2 = x_2 + iy_2$$

$$z_1 + z_2 = (x_1 + x_2) + i(y_1 + y_2)$$

$$z_1 \cdot z_2 = (x_1 x_2 - y_1 y_2) + i(x_1 y_2 + x_2 y_1)$$

Factorization

Factorization of $x^n - 1$

$$x^2 - 1 = (x + 1)(x - 1)$$

$$x^3 - 1 = (x - 1)(x^2 + x + 1)$$

$$x^4 - 1 = (x - 1)(x + 1)(x^2 + 1)$$

Visual Factorization

$$x^2 - 1 = (x + 1)(x - 1)$$

$$x^2 - 1 = (PC_1)(PC_2)$$

Visual Factorization of $x^4 - 1$

$$x^4 - 1 = (x - 1)(x + 1)\sqrt{x^2 + 1}\sqrt{x^2 + 1}$$

$$x^4 - 1 = (PC_1)(PC_2)(PC_3)(PC_4)$$

Visual factorization of $x^3 - 1$

$$\begin{aligned}
 x^3 - 1 &= (x - 1)(x^2 + x + 1) \\
 &= (x - 1)\sqrt{(x + 1/2)^2 + (\sqrt{3}/2)^2} \sqrt{(x + 1/2)^2 + (\sqrt{3}/2)^2}
 \end{aligned}$$

The Complex Plane

Complex numbers as 'vectors'

Visualization of addition of complex numbers: Parallelogram Rule

Polar Representation

Polar Representation

$$z = r(\cos \theta + i \sin \theta)$$

Euler's formula

Euler's Formula:

$$e^{i\theta} = \cos \theta + i \sin \theta$$

where

$$\begin{aligned} e^{i\theta} &= 1 + i\theta + \frac{1}{2!} (i\theta)^2 + \frac{1}{3!} (i\theta)^3 + \frac{1}{4!} (i\theta)^4 + \dots \quad (\text{definition}) \\ &= \left(\theta - \frac{1}{3!}\theta^3 + \frac{1}{5!}\theta^5 \dots \right) + i \left(1 - \frac{1}{2!}\theta^2 + \frac{1}{4!}\theta^4 \dots \right) \\ &= \cos \theta + i \sin \theta \end{aligned}$$

Given series definition of e^a , it follows

$$e^a e^b = e^{a+b} \quad a, b \in \mathbb{C}$$

$$\begin{aligned} z_1 \cdot z_2 &= r_1 e^{i\theta_1} r_2 e^{i\theta_2} \\ &= (r_1 r_2) e^{i(\theta_1 + \theta_2)} \end{aligned}$$

Visualization of product of complex numbers:
